

# Optics

2014

# Mirror Lab

Pick up;  
a ruler  
a mirror  
a protractor  
a 200g or 100g mass  
1 sheet of paper

Finding Virtual  
Images

- Fold the paper in half
- Trace the center line
- Draw a simple object

**Stand up the mirror on  
the center line**

Stand up the mirror on  
the center line

You may slide the mirror  
left or right to correctly  
see the image

Move away the mirror  
Extend your sight lines  
through to find their  
intersection point

# Measurements

	D	D	$\theta$	$\theta$
A				
B				
C				

Distances - from the mirror line  
Angles - From a perpendicular line to the mirror

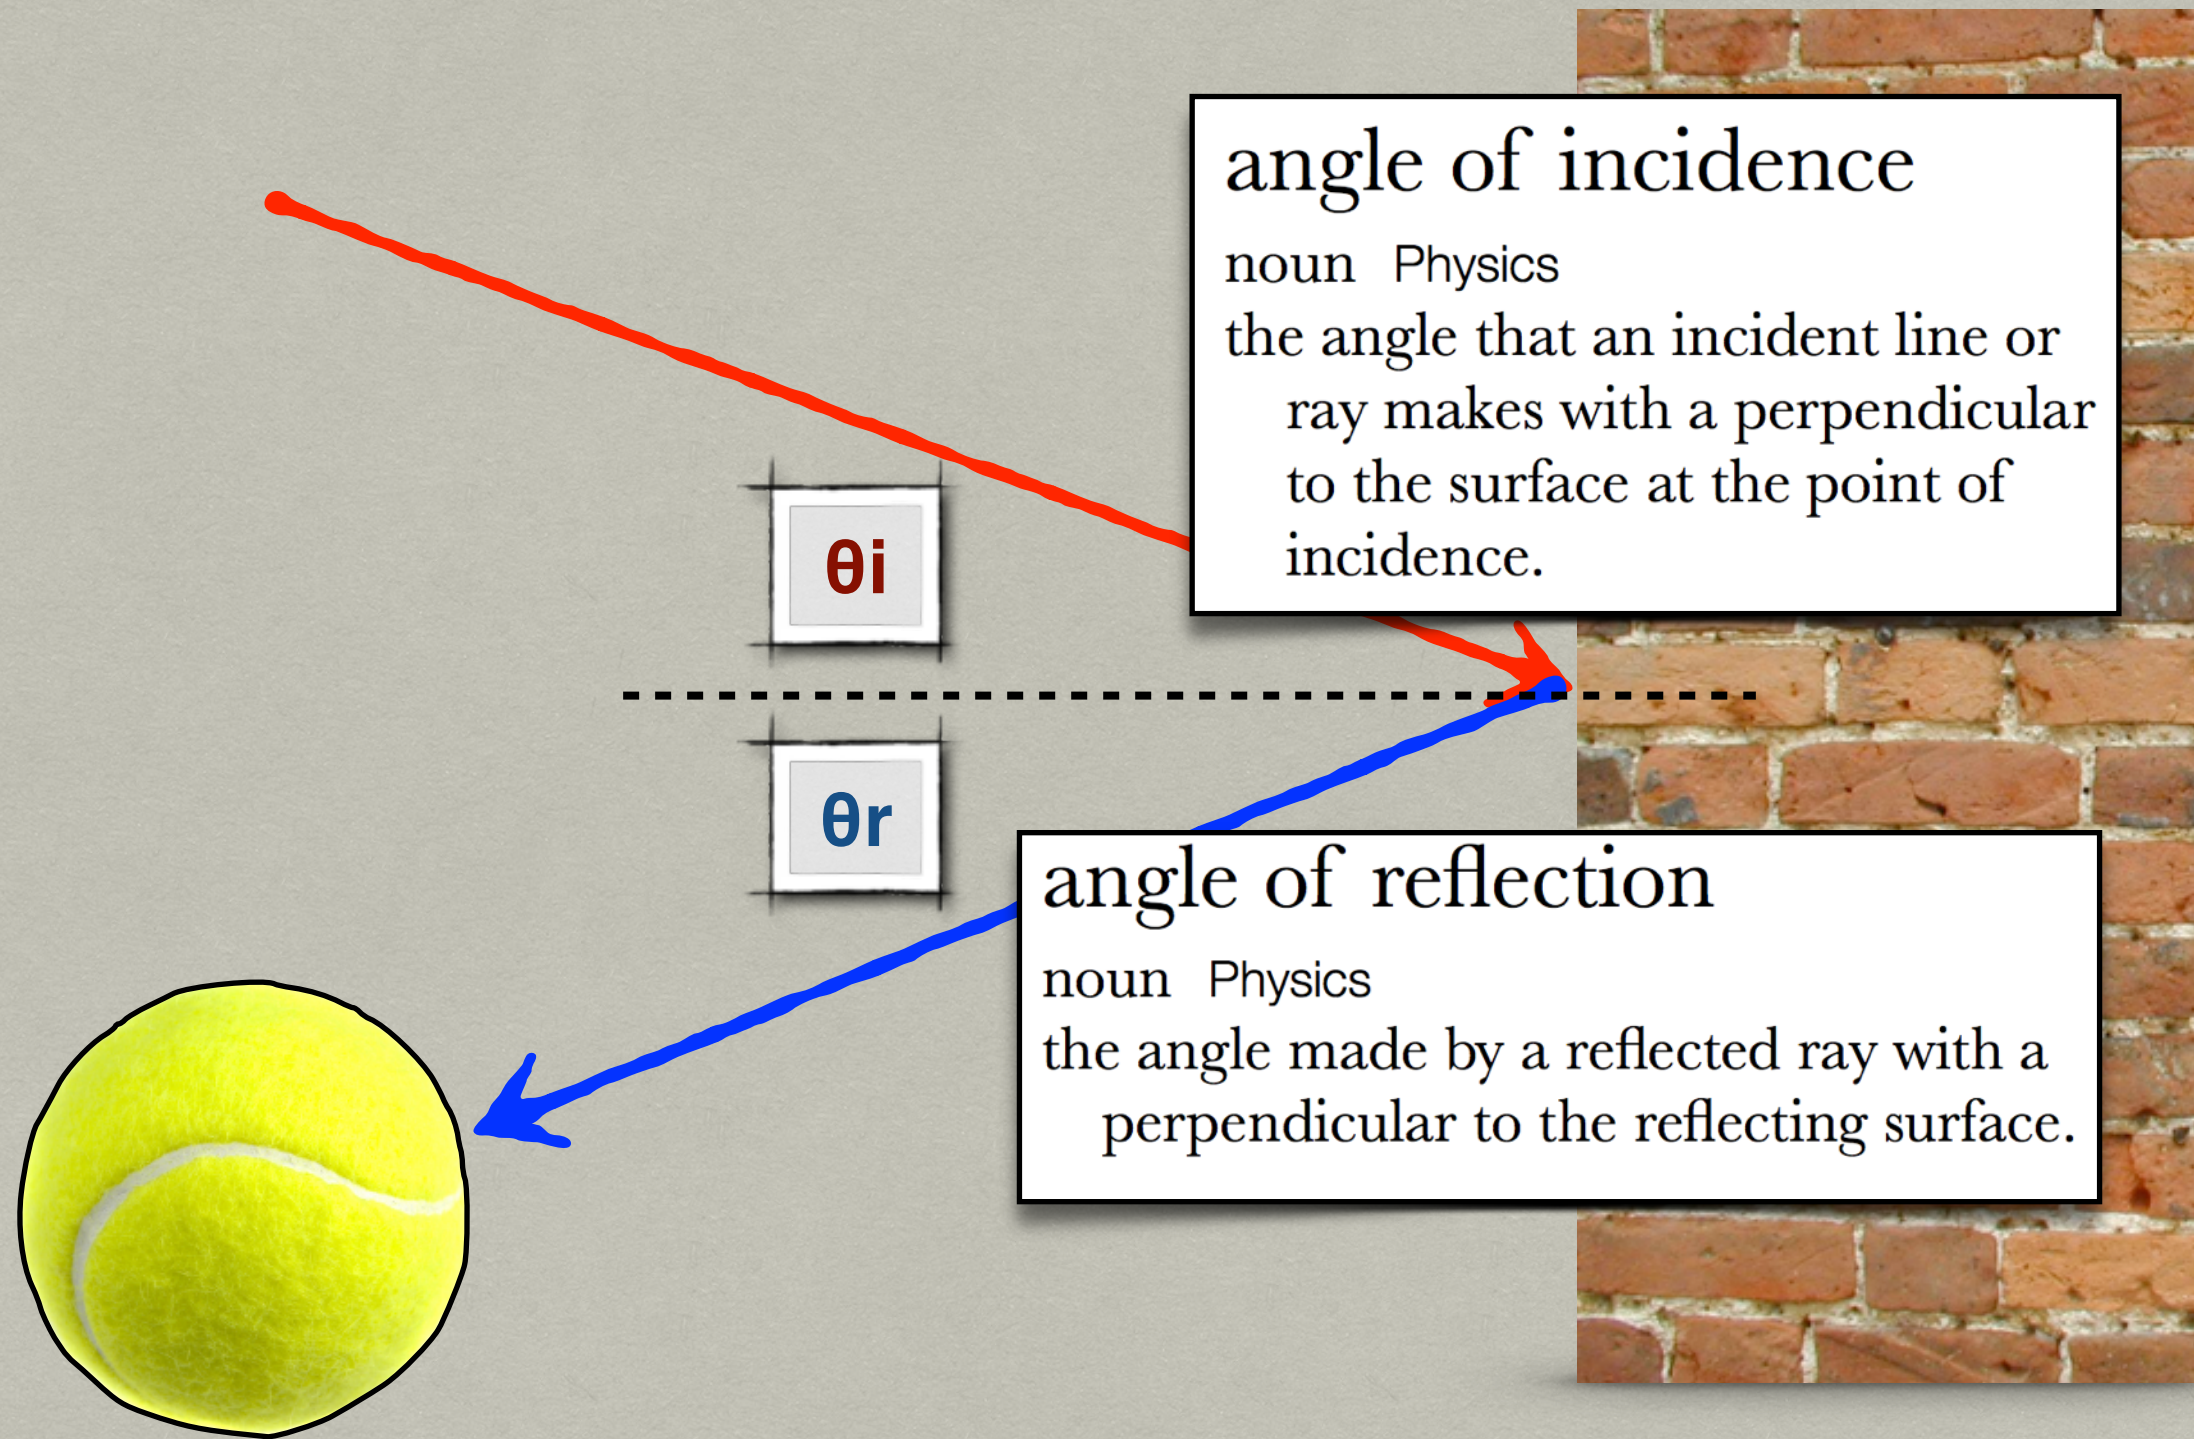

# Measure Carefully

Real Images are positive  
Virtual Images are negative distances

# Angles of Reflection

# Additional construction

	Di	Do	$\theta_i$	$\theta_r$
A				
B				
C				

●  $A^1$

Angles are measured from the normal line at the mirror

# Snell's Law Lab

Questions?

# Set Up

**you'll need...**  
(get from the front table)

**paper,  
glass,  
a ruler,  
and a protractor**

# Angle of Incidence

# Find the image

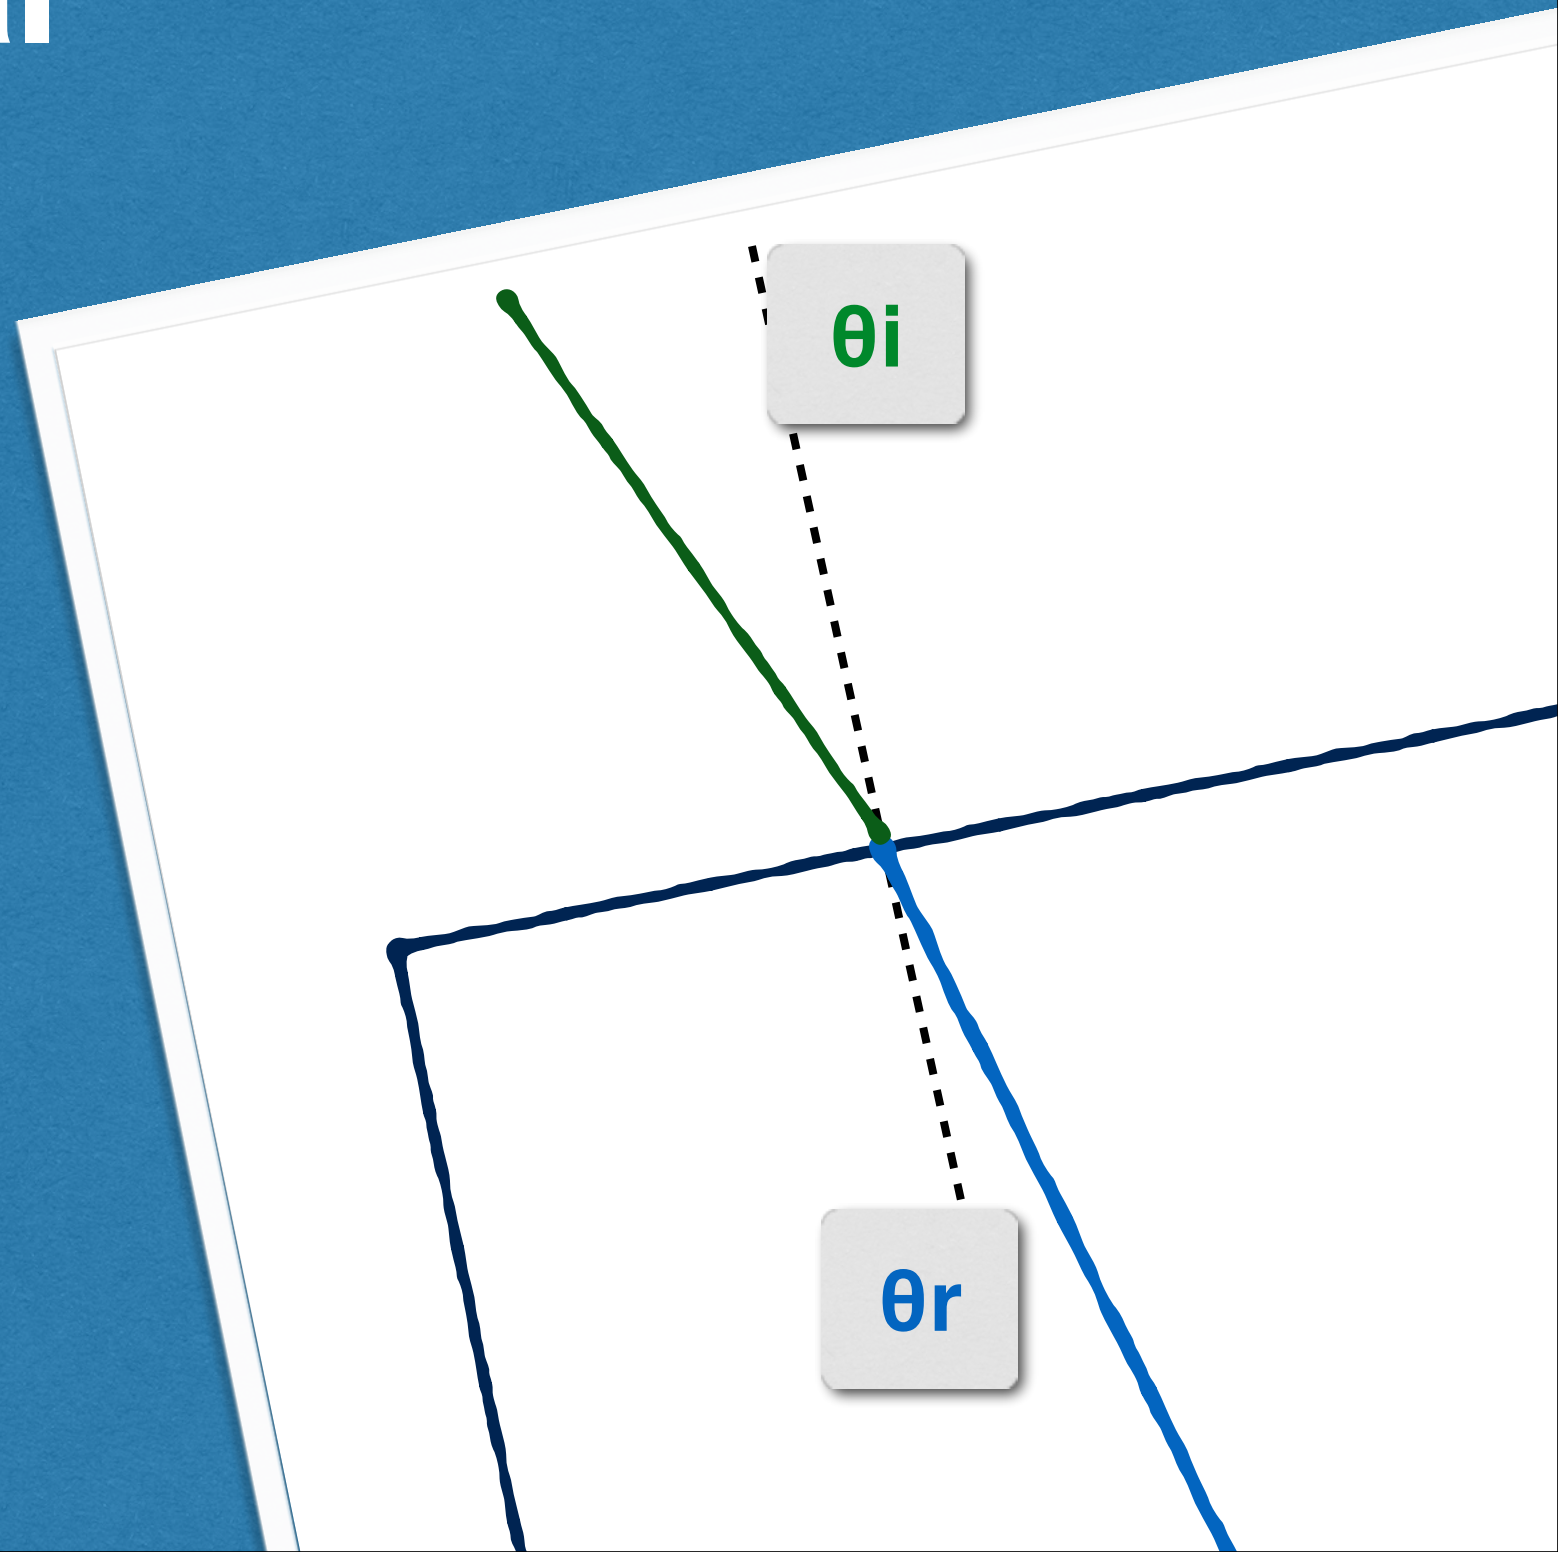

# Angle of Refraction

Observe  
The smaller angle  
is in the material  
that is more  
optically dense

# Data/ Calculations

$\theta_i$	$\theta_r$	$\frac{\sin \theta_i}{\sin \theta_r}$
$30^\circ$		
$40^\circ$		
$50^\circ$		

# Index of Refraction

Questions?

# Snell's Law

Willebrord Snell  
1591-1626

Index of Refraction:  
a ratio of the speed of light  
in a vacuum to the speed of  
light in a medium

$$n = c / v$$

vacuum	$n = 1.0$
air	$n = 1.0003$
water	$n = 1.33$
glass	$n = 1.5$

# Where the waves bend

$$n_g \sin \theta_g = n_a \sin \theta_a$$

# How do you skip a rock?

Think  
about it

# Internal Reflection

The critical angle of incidence creates a  $90^\circ$  angle of refraction

# Internal Reflection

Only occurs when light passes from a more dense into a less dense medium.

Occurs when the angle of incidence is greater than the critical angle
