

## Math with Scientific Notation

## Prefixes You Must Know

| Power of 10 | Exponent | Prefix | Symbol | Common Name |
| :---: | :---: | :---: | :---: | :---: |
| 9 | $10^{9}$ | giga | G | billion |
| 6 | $10^{6}$ | mega | M | million |
| 3 | $10^{3}$ | kilo | k | thousand |
| 2 | $10^{2}$ | hecto | h | hundred |
| 1 | $10^{1}$ | deca | da | ten |
| -1 | $10^{-1}$ | deci | d | tenth |
| -2 | $10^{-2}$ | centi | c | hundredth |
| -3 | $10^{-3}$ | milli | m | thousandth |
| -6 | $10^{-6}$ | micro | H | millionth |
| -9 | $10^{-9}$ | nano | n | billionth |

# Time to <br> <br> Forget Henry 

 <br> <br> Forget Henry}

- King Henry Did Usually Drink Chocolate Milk.. but that's for kids.

## KING HENRY'S

chocolate 1\% © Eelat

## Scientific Notation

- A number in scientific notation looks like...

## $4.25 \times 10^{3} \mathrm{~m}$

- Number
- Must start with an integer from 1 to 9
- $0.21 \times 10^{2}$ isn't quite right
- Power of 10
- Units
- one of the most important parts

## Easier to Read

## $300,000,000 \mathrm{~m} / \mathrm{s}$

- the speed of light is $300,000,000$ meters each second
- Find the decimal
- Move the decimal - count how far it goes
- Use that for the exponent

## Which is Easier to Read?

## $300,000,000 \mathrm{~m} / \mathrm{s}$ or..

$$
3 \times 10^{8} \mathrm{~m} / \mathrm{s}
$$

## Easier to Read

### 0.0000065 m

- Really small numbers work too
- Find the decimal
- Move the decimal - count how far it goes
- This time, the exponent is negative

## Which is Appropriate?

### 0.0000065 m or..

## $6.5 \times 10^{-6} \mathrm{~m}$ or..

## $6.5 \mu \mathrm{~m}$

## Not as Far To Go

## $8500 \times 10^{6} \mathrm{~g}$

- This number isn't quite in scientific notation
- Find the decimal
- Move the decimal \& count how far it goes
- Change the exponent by that much

## $8500 \times 10^{6} \mathrm{~g}$

- You moved the decimal 3 times
- The number "looks" smaller
- The exponent must become bigger by 3

$$
8.5 \times 10^{9} \mathrm{~g}
$$

## Practice

# Change these into scientific notation 

38,600 m<br>157,300 s<br>147 cm<br>93,000,000 miles

# Change these into scientific notation 

0.715 kg
0.00083 g
0.000025 s
0.00083 m

## Change these OUT OF scientific notation

$9.3 \times 10^{6} \mathrm{~kg}$<br>$3.75 \times 10^{2} \mathrm{~m}$<br>$8 \times 10^{4} \mathrm{~N}$<br>$2.39 \times 10^{18} \mathrm{~S}$

## Change these OUT OF scientific notation

$4.8 \times 10^{-5} \mathrm{~kg}$<br>$7.21 \times 10^{-3} \mathrm{~m}$<br>$3 \times 10^{-2} \mathrm{~N}$<br>$5.9 \times 10^{-9} \mathrm{~s}$

## Change these into the required power of ten

 (does not require scientific notation)(103) $38,600 \mathrm{~m}$
(103) $1,450 \mathrm{~g}$
(10 $\left.{ }^{6}\right)$ 540,000 Watts
$\left(10^{-3}\right) \quad 0.0253 \mathrm{~s}$

## Changing the Prefix

## Conversions powers of 10

- How many centimeters are in 6.8 meters?
- $1 \mathrm{~m}=1 \times 10^{2} \mathrm{~cm}$
- (or $1 \mathrm{~cm}=1 \times 10^{-2} \mathrm{~m}$ )
- $6.8 \mathrm{~m}=6.8 \times 10^{2} \mathrm{~cm}$
- and you can say 680 if you'd prefer

## Two steps

- How many cm are in 5 km?
- Work with each prefix
- $1 \mathrm{~km}=1 \times 10^{3} \mathrm{~m}$
- $1 \mathrm{~cm}=1 \times 10^{-2} \mathrm{~m}$
- the two are 5 places apart

## Watch Directions!

- Decision: How many cm are in 5 km ?
- is it $5 \times 10^{5}$ or $5 \times 10^{-5}$
- a lot or only a part of one?
- 500,000 or 0.00005
- $5 \times 10^{5} \mathrm{~cm}$ in 5 km

## Math with Exponents

## Multiplication

- What is 640,000 times 20,000 ?
- $\left(6.4 \times 10^{5}\right) \times\left(2 \times 10^{4}\right)$
- multiply the values $(6.4 \times 2=12.8)$
- Add the exponents $5+4=9$
- state your answer $12.8 \times 10^{9}$

## Division

- $\left(6.4 \times 10^{5}\right) /\left(2 \times 10^{4}\right)$
- divide the values ( $6.4 / 2=3.2$ )
- subtract the exponents 5-4=1
- state your answer $3.2 \times 10^{1}$
- Unless you MUST use scientific notation, simplify your answer to 32

## Practice

$\left(7.2 \times 10^{4}\right) \times\left(3 \times 10^{3}\right)$
$\left(4.2 \times 10^{5}\right) \times\left(6 \times 10^{-2}\right)$
$\left(6.3 \times 10^{4}\right) /\left(3 \times 10^{3}\right)$
$\left(4.8 \times 10^{5}\right) /\left(6 \times 10^{-2}\right)$

# What is... <br> <br> l dollar plus l dime? 

 <br> <br> l dollar plus l dime?}

- Is it 2 of anything?
- 1.10 dollars
- 11 dimes
- How do you get these answers?

## Addition

- $\left(6.4 \times 10^{5}\right)+\left(2 \times 10^{4}\right)$
- Pick one to change
- $\left(64 \times 10^{4}\right)+\left(2 \times 10^{4}\right)$
- $66 \times 10^{4}$
- or $6.6 \times 10^{5}$

## Practice

$\left(3.5 \times 10^{4}\right)-\left(2.8 \times 10^{3}\right)$
$\left(5 \times 10^{6}\right)+\left(0.51 \times 10^{8}\right)$
$\left(6.0 \times 10^{-3}\right)+\left(5.0 \times 10^{-4}\right)$
$\left(5.0 \times 10^{9}\right)+\left(3.0 \times 10^{-1}\right)$

Does that last one seem strange to solve?
